

Ala Raies

Senior .NET Developer

alaraies1@gmail.com — +216 50 809 502

Summary

Senior Full Stack Developer (.NET/Angular) with over 5 years of experience in the financial sector, working in Agile and international environments. Specialized in the design and development of high-volume portfolio management and trading solutions that are highly scalable and performant. Skilled in **microservices architectures**, **optimized APIs**, **CI/CD**, and SQL databases, with proven expertise in **C#**, **.NET Core**, and **Angular**. Experienced in requirements analysis, technical design, Fullstack development, deployment automation, Cloud integration, and containerized solution delivery. Passionate about innovation, I also integrate artificial intelligence tools into business processes to address real-world use cases and enhance the value of financial systems.

Technical Skills

Languages	C#, JavaScript, TypeScript, SQL
Frameworks & Web	.NET Framework, .NET Core, ASP.NET, Angular, WinForms
Databases	SQL Server, PostgreSQL
Tools & Cloud	Azure DevOps, Docker, Kubernetes, Jenkins, OpenShift
Methodologies	TDD, DDD, Clean Architecture, CI/CD, Agile/Scrum

Professional Experience

Zembra — .NET Developer

January 2025 – Present

Context:

Development of a strategic and highly critical portfolio management solution, handling complex and high-stakes financial processes. The application enables bankers to execute financial transactions across a large number of portfolios (buy/sell securities, rebalancing via model portfolios, liquidation, financial simulation, cash management), with strict requirements for speed, reliability, and compliance with both client and banker constraints.

Responsibilities:

- Developed new features for portfolio management (transactions, simulations, cash handling, constraints).
- Designed and optimized high-performance APIs, consumed by user interfaces and external systems.
- Developed user interfaces tailored to business needs.
- Optimized processes to support high traffic and ensure speed and reliability.
- Implemented and monitored continuous delivery pipelines via Azure DevOps (CI/CD).
- Deployed containerized applications on OpenShift to ensure scalability and portability.
- Actively participated in Agile/Scrum ceremonies and coordinated with business and technical teams.

Achievements:

- Designed, developed, and implemented the **portfolio rebalancing module** based on model portfolios.
- Designed, developed, and implemented the **cash management module**.
- Designed, developed, and implemented the **financial simulation module**.
- Designed, developed, and implemented the **constraint configuration and calculation module**.
- Implemented a **real-time financial transactions module with Kafka**.
- **Improved user experience** with fluid screens adapted to complex business processes.
- **Created AI agents with Microsoft Agent Framework**, adding agentic capabilities (portfolio filters generated from natural text).

Tech Stack: .NET Core, EF Core, Angular, Clean Architecture, Microservices, Multithreading, TDD, DDD, OpenShift, Azure DevOps, Kafka

Technical Center of Excellence — .NET Developer

July 2023 – December 2024

Context:

Cross-functional mission within the Technical Center of Excellence, with a transitional role aimed at modernizing the way banking applications are built. The objective was to define and prepare a new technology stack, auditing legacy systems and establishing the technical foundations for upcoming projects.

Responsibilities:

- Conducted technical audits on legacy systems to identify modernization opportunities.
- Defined and implemented the complete stack for new projects (framework, libraries, ORM, audit log, logging, front-end, observability, testing framework).
- Designed and developed internal SDKs to standardize development practices.
- Containerized applications and prepared deployments on OpenShift.
- Implemented cross-cutting solutions to address team needs (performance, traceability, quality).
- Supported development teams in adopting new practices.

Achievements:

- Created **developer guidelines** for the use of new frameworks and technologies.
- Developed a **dedicated audit SDK**, facilitating application traceability.
- Authored **guidelines for Entity Framework Core**.
- Implemented **Grafana and observability stack** for application monitoring.
- Prepared **guidelines for C# application instrumentation**.
- Collaborated with the Zembra team (BA and dev) to define their next highly scalable microservices solution.

Tech Stack: .NET Framework, C#, EF Core, SQL Server, OpenShift, Grafana, Azure DevOps, Agile/Scrum

Lutèce Portfolio Management — .NET Developer

January 2022 – June 2023

Context:

Participation in the development and evolution of the bank's legacy portfolio management system, a critical application covering financial transactions (trading), reporting, and account management with client constraints. A high-stakes solution exposed to significant financial risks and handling heavy traffic, requiring maximum reliability and continuous performance optimization.

Responsibilities:

- Developed new features involving the creation of optimized APIs and new user interfaces.

- Designed and implemented UI pages and components dedicated to reference data and client constraints management.
- Maintained existing processes and provided technical support in case of production incidents.
- Optimized processes and APIs to support increasing volumes of transactions and reporting.
- Actively participated in Agile/Scrum ceremonies and coordinated with business teams.
- Ensured continuous delivery and deployment quality via Azure DevOps (CI/CD).

Achievements:

- Redesigned the **MiFID module**, ensuring regulatory compliance of client transactions.
- Redesigned the **Securities Operations module**, enabling bankers to record client responses to Corporate Actions.
- Developed the **ESG module**, integrating new environmental and social criteria into portfolio management.
- Optimized critical APIs used both for reporting and by external applications, reducing response times and increasing reliability.
- Migrated the system backend from **.NET Framework 4.6 to 4.8.1**, strengthening application stability and compatibility.

Tech Stack: .NET Framework, DurandalJS, SQL Server, Azure DevOps, Agile/Scrum

Lutèce Core Banking — Full Stack Developer

February 2021 – December 2021

Context:

Participation in the development and evolution of Lutèce's Core Banking system, with a focus on reference data management (accounts, third parties) and optimization of critical core banking operations. Project carried out in an Agile/Scrum environment, in close collaboration with business and technical teams.

Responsibilities:

- Designed and developed reusable UI components and web pages dedicated to reference data management (accounts, third parties).
- Developed and optimized APIs consumed by user interfaces.
- Provided technical and functional support to users and business teams in production.
- Implemented and monitored continuous delivery pipelines via Jenkins (CI/CD).
- Actively participated in Agile/Scrum ceremonies and coordinated with development and business teams.

Achievements:

- Designed robust and high-performance APIs, improving the reliability of banking operations.
- Developed reusable UI components, accelerating the implementation of new features.
- Optimized execution time of certain Core Banking operations, enhancing overall system efficiency.

Tech Stack: .NET Framework, DurandalJS, SQL Server, Jenkins, Agile/Scrum

GUIT — Full Stack Developer

October 2018 – September 2019

Context:

Development of an internal automated testing engine built on top of Selenium, with the primary objective of significantly reducing UI test development time. Project carried out in an Agile environment, in close collaboration with business and technical teams.

Responsibilities:

- Requirements analysis and technical design of the testing platform.
- Fullstack development of the tool using .NET Framework and DurandalJS.
- Implementation of custom Selenium components to automate complex scenarios.
- Design of a robust and extensible execution engine.
- Setup of CI/CD pipelines with Jenkins to ensure reliable deployments.
- Collaboration with business teams to adapt tests to real use cases.

Achievements:

- Created an internal platform that reduced UI test development time and accelerated delivery validation.
- Improved test coverage and reduced anomalies detected in production.
- Implemented a scalable architecture facilitating the addition of new scenarios and components.

Tech Stack: .NET Framework, DurandalJS, Selenium, SQL Server, Jenkins, Agile/Scrum

Education

Engineering Degree, ENIT

2016 – 2019

Specialization in Electrical Engineering, Microsystems, and Embedded Systems Design.
